1. 前言

1.1. 编写目的

了解 tp 独立供电注意事项。

1.2. 适用范围

介绍本模块设计适用 R16 平台。

1.3. 相关人员

客户

2. TP 独立供电使用注意事项

R16 标案 tp 采用独立供电。驱动中对 tp 电源独立管理。使用 tp 独立供电有以下几点要注意。

1. 在 lichee/tools/pack/chips/sun8iw5p1/configs/xxx/sys_config.fex 增加了如下红色标记 三项内容:

```
[ctp para]
ctp used
                    = 1
                     = "ft5x ts"
ctp name
ctp twi id
                    =0
ctp twi addr
                    = 0x38
ctp screen max x
                    = 768
ctp screen max y
                    = 1024
ctp revert x flag
                  =0
ctp revert y flag
                  =0
ctp exchange x y flag = 0
ctp int port
                   = port:PB05<4><default><default>
ctp wakeup
                     = port:PH01<1><default><default><1>
                     = "axp22 eldo1"
ctp power ldo
ctp power ldo vol
                    = 3000
ctp power io
```

ctp_power_ldo 用于配置 tp 供电的 ldo 名称,ctp_power_ldo_vol 用于配置所用 ldo 电压,ctp_power_io 暂不使用。配置方式可以参照上述配置。如不使用独立供电,可以把相应配置置空。

2. 在内核 lichee/linux-3.4/drivers/input/init-input.c 文件中增加相关接口获取电源配置参数并获取相应的 ldo 句柄,设置 ldo 电压。为了方便客户在 tp 驱动中控制电源的开关,增加了接口:

int input set power enable(enum input sensor type *input type, u32 enable)

此接口 export 给驱动使用,客户无需更改。

- 3. tp 驱动
 - a) 初始化

```
如果使用独立供电,客户需要在 tp 驱动初始化中加入相关的电源开关,示例如下: static int __init ft5x_ts_init(void) {
```

```
int ret = -1;
```

dprintk(DEBUG_INIT,"*****************init

```
begin************/n"):
        if (input fetch sysconfig para(&(config info.input type))) {
                 printk("%s: ctp fetch sysconfig para err.\n", func );
                 return 0;
        } else {
                 ret = input init platform resource(&(config info.input type));
                 if (0 != ret) {
                         printk("%s:ctp ops.init platform resource err. \n", func );
                 }
        }
        if(config info.ctp used == 0){
                 printk("*** ctp_used set to 0 !\n");
                 printk("*** if use ctp,please put the sys config.fex ctp_used set to 1. \n");
                 return 0;
        }
        if(!ctp get system config()){
                 printk("%s:read config fail!\n", func );
                 return ret;
        }
        input set power enable(&(config info.input type), 1);
        msleep(10);
        ctp_wakeup(0, 10);
        ft5x ts driver.detect = ctp detect;
        ret= register chrdev(I2C MAJOR, "aw i2c ts", &aw i2c ts fops);
        if(ret) {
                 printk("%s:register chrdev failed\n", FILE );
                 return ret;
        }
   b) 休眠唤醒
   为了节省功耗,一般需要在休眠唤醒中加入电源管理,休眠时关电,唤醒时开电。
但如果采用不带 flash 的 tp ic,下载参数较慢,影响体验,可以在休眠时保留 tp 电不断。
不同驱动添加方式略有不同,请参考标案代码处理。
   c) 退出
   static int devexit ft5x ts remove(struct i2c client *client)
            struct ft5x ts data *ft5x ts = i2c get clientdata(client);
            ft5x set reg(FT5X0X REG PMODE, PMODE HIBERNATE);
```

```
printk("==ft5x ts remove=\n");
         device destroy(i2c dev class, MKDEV(I2C MAJOR, client->adapter->nr));
         input_free_int(&(config_info.input_type), ft5x_ts);
#ifdef CONFIG HAS EARLYSUSPEND
         unregister early suspend(&ft5x ts->early suspend);
#endif
         cancel work sync(&ft5x resume work);
         destroy workqueue(ft5x resume wq);
         input unregister device(ft5x ts->input dev);
         input free device(ft5x ts->input dev);
         cancel work sync(&ft5x ts->pen event work);
         destroy workqueue(ft5x ts->ts workqueue);
         input set power enable(&(config info.input type), 0);
         kfree(ft5x ts);
         i2c set clientdata(this client, NULL);
         return 0;
}
```
